

Abstract and Introduction

Project: Import Data using Transform Maps (Spreadsheet)

Platform: ServiceNow

7.1 Abstract

This project imports structured employee data from a spreadsheet into ServiceNow using Import Sets and Transform Maps. Data is first loaded into a staging table, then mapped and transformed into the target table with duplicate control, producing accurate records and a full audit trail without manual data entry.

7.2 Introduction and Objectives

Organizations frequently receive bulk employee data in Excel or CSV files. Loading such data manually is slow and error-prone.

Objectives

- Automate loading of spreadsheet data into ServiceNow.
- Map source columns to target fields using a Transform Map.
- Prevent duplicate records using Coalesce.
- Verify results using Transform History and Import Log.

7.3 System Overview
