

Transform Map Configuration

Project: Import Data using Transform Maps (Spreadsheet)

Platform: ServiceNow

5.4 Create the Transform Map

Navigate to **System Import Sets > Administration > Transform Maps > New**.

Field	Value
Name	Employee Import to User
Source table	Employee Import (Import Set table)
Target table	User [sys_user]
Run business rules	Checked

Save, then use **Auto Map Matching Fields** and add the remaining maps in the Field Maps related list.

5.5 Define Field Maps and Coalesce

Source Field	Target Field	Coalesce
u_employee_id	employee_number	Yes
u_first_name	first_name	No
u_last_name	last_name	No
u_email	email	No
u_department	department	No
u_title	title	No

Coalesce on Employee ID makes ServiceNow update an existing user instead of creating a duplicate.

5.6 Optional Transform Script (onBefore)

Use this to clean the data before it is written to the target table.

```
(function runTransformScript(source, map, log, target) {  
  // Standardise email to lower case  
  if (source.u_email) {  
    target.email = source.u_email.toString().toLowerCase();  
  }  
})(source, map, log, target);
```
